

Monograph Retrieval (BB3) — Component Diagram (C4 level 3)

How a medication question is resolved, scoped, retrieved and guarded — and the single hop that leaves our network.

Resolve first, retrieve second

The resolver is the only door: retrieval is always scoped to a resolved DIN set. When it cannot resolve the question it asks — confirm, pick_list or not_found — and no model runs at all.

BB3 retrieves and guards; it does not speak

The local model stays as the offline fallback and the evaluation harness. The production voice is a cloud model, and BB3's guards run on its answer exactly as they ran on the local one's.

One hop leaves our network, and only one

It carries the question and the passages BB3 already retrieved — no identity, no medication profile, no photo. Everything else on this page runs on hardware the project owns.
