

Pill Vision (IMB1) — Component Diagram (C4 level 3)

What ships today, what is built but switched off, and how the two-stage reader arriving behind it changes the imprint — as of 2026-08-12.

Zero-shot won twice, and it was measured

The fine-tuned detector missed pills the zero-shot one found, and the trained shape head wins in a studio eval while costing accuracy on real photos.

Colour is measured, not classified

The card's printed patches white-balance the frame before the colour is looked up. No training set gets a vote on what colour a pill is.

Two stages, two runtimes, one GPU

A3 asks whether an imprint exists; A4c ranks a ballot and reports a margin. They are different models on different runtimes, swapped on demand.

LIVE in production IMB1_v0/ today

BUILT · OFF in NB08_Notebook/src/, default-off, not promoted

STEP 7 specified, not wired into the pipeline
